

Simulation: Addressing the Challenges of Low Frequency Pediatric Emergencies

Gary L. Geis, MD

Cincinnati Children's Hospital Medical Center
University of Cincinnati, College of Medicine

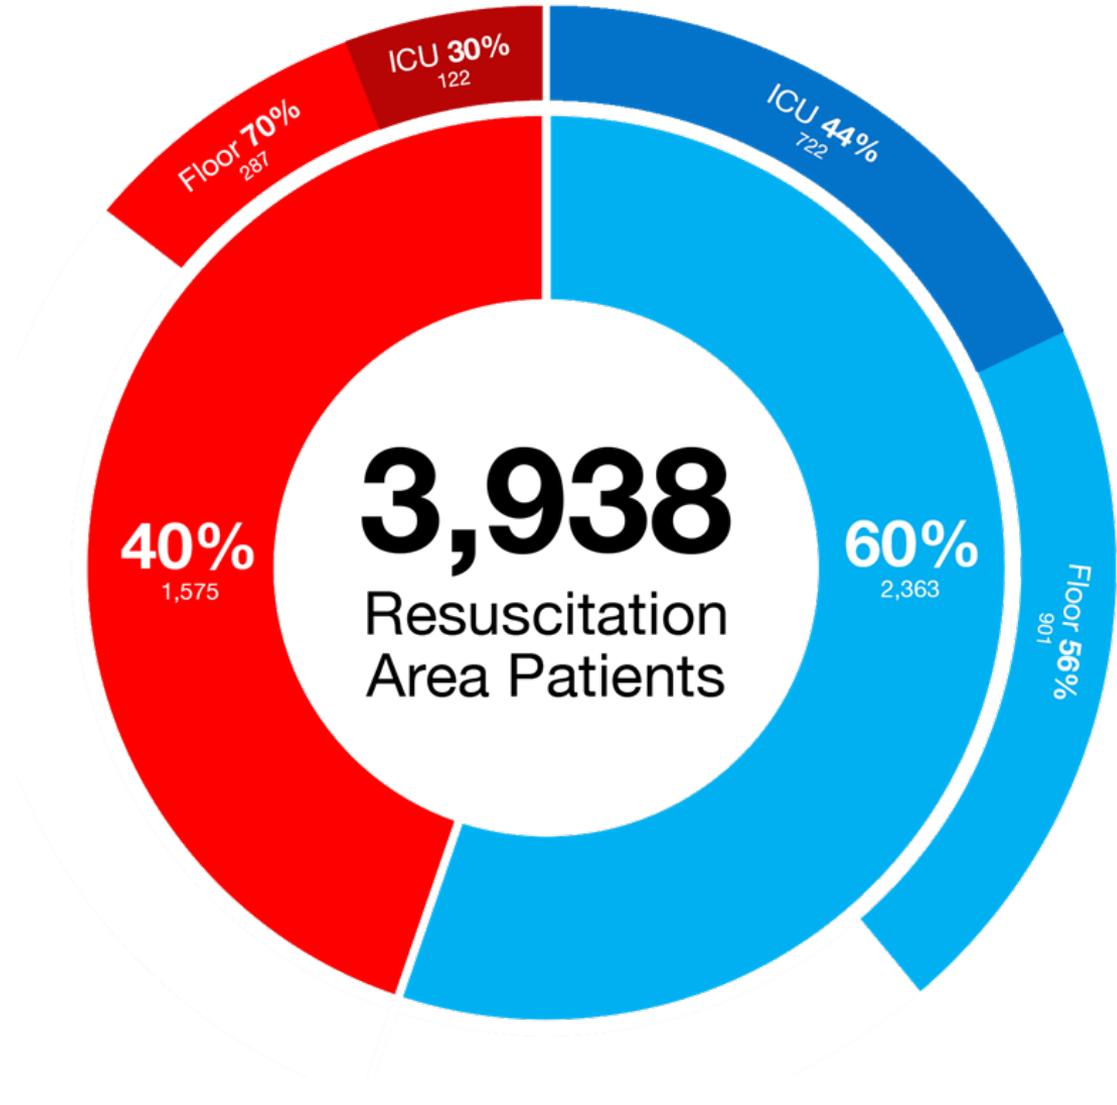

Approach

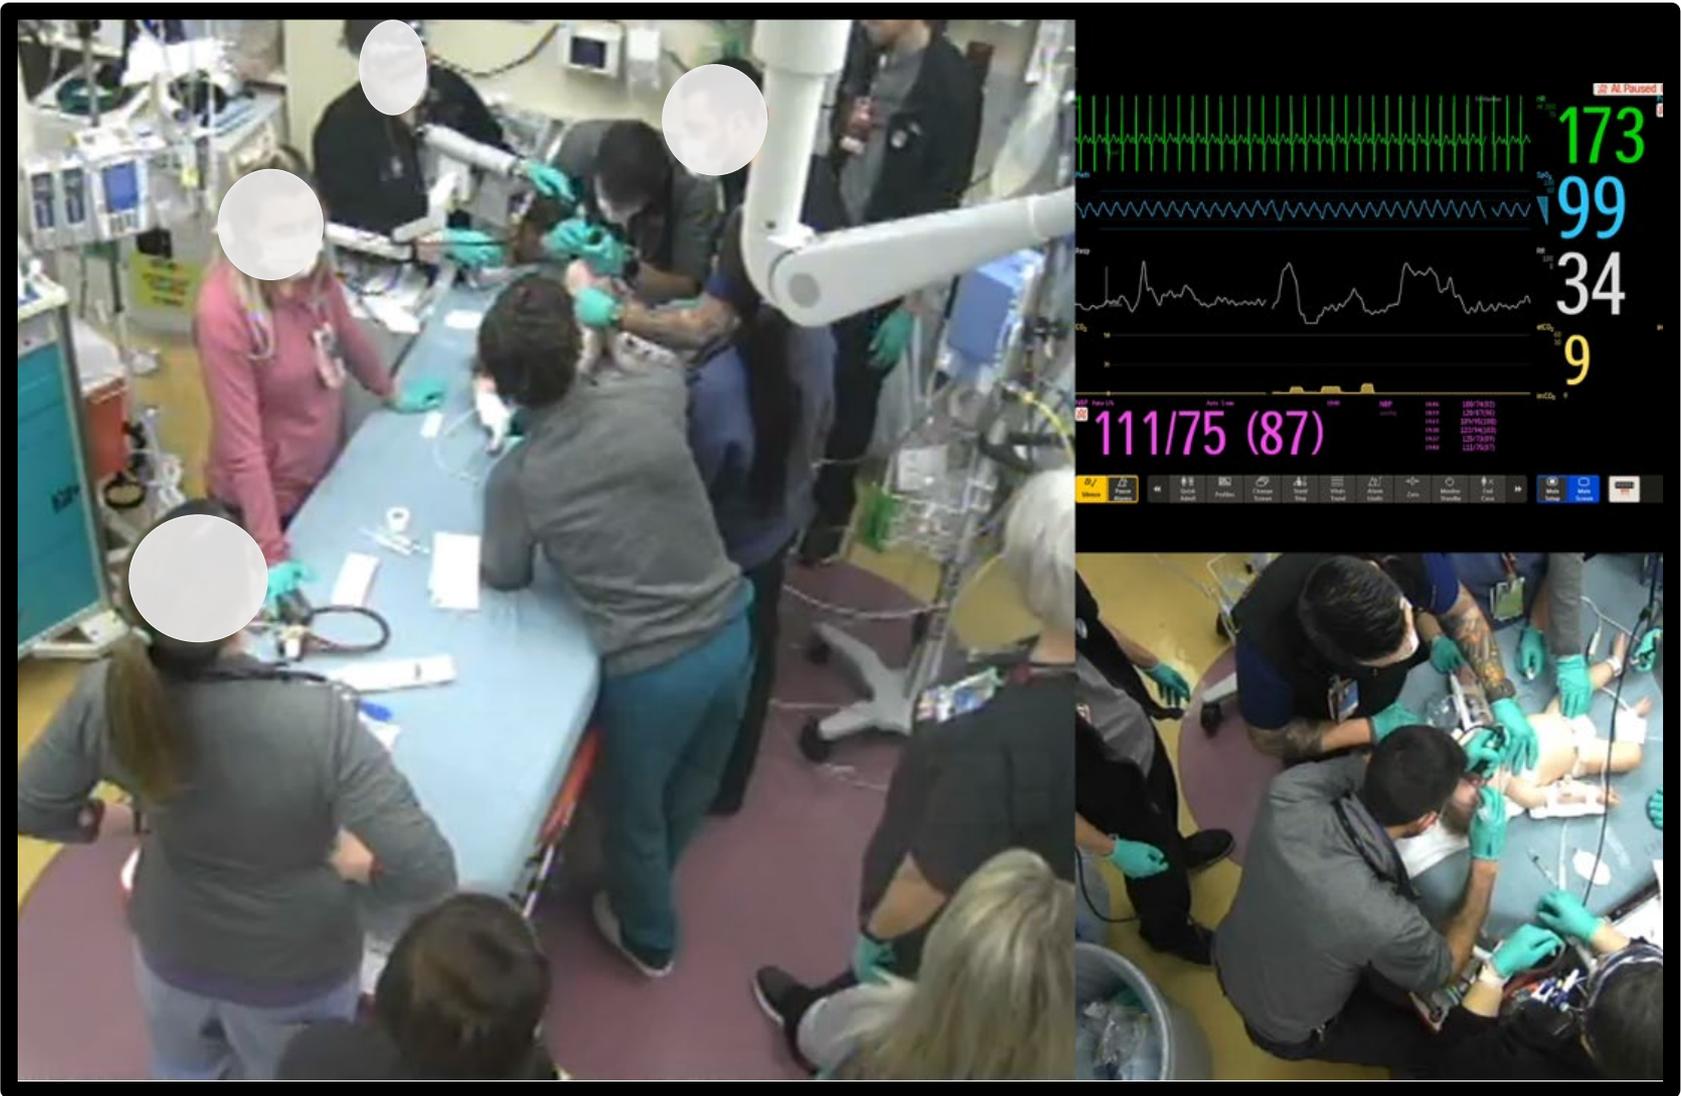

- When problems or barriers are identified, they are represented through simulation allowing us to:
 - Increase the “n”
 - Explore new solutions
 - Measure chosen outcomes
 - Implement & monitor revised clinical practices

Setting

Trauma

Medical

Problem

- Low Frequency: 261 procedures, 194 patients (0.2% ED patients)

Procedure	2009-10
Tracheal intubation	147
Intraosseous catheter	41
Tube thoracostomy	18
Central line	15

- Median faculty procedures = 0

Problem

Methods

- Video review of RSI
- 12 months

Results

- 48% 1st attempt failure
- 33% desaturation
 - Prolonged attempt duration
 - Younger age
- 20% esophageal placement

Strategy

Simulation

Non-technical Training

Teamwork

Communication

Team Leadership

Use of cognitive aids

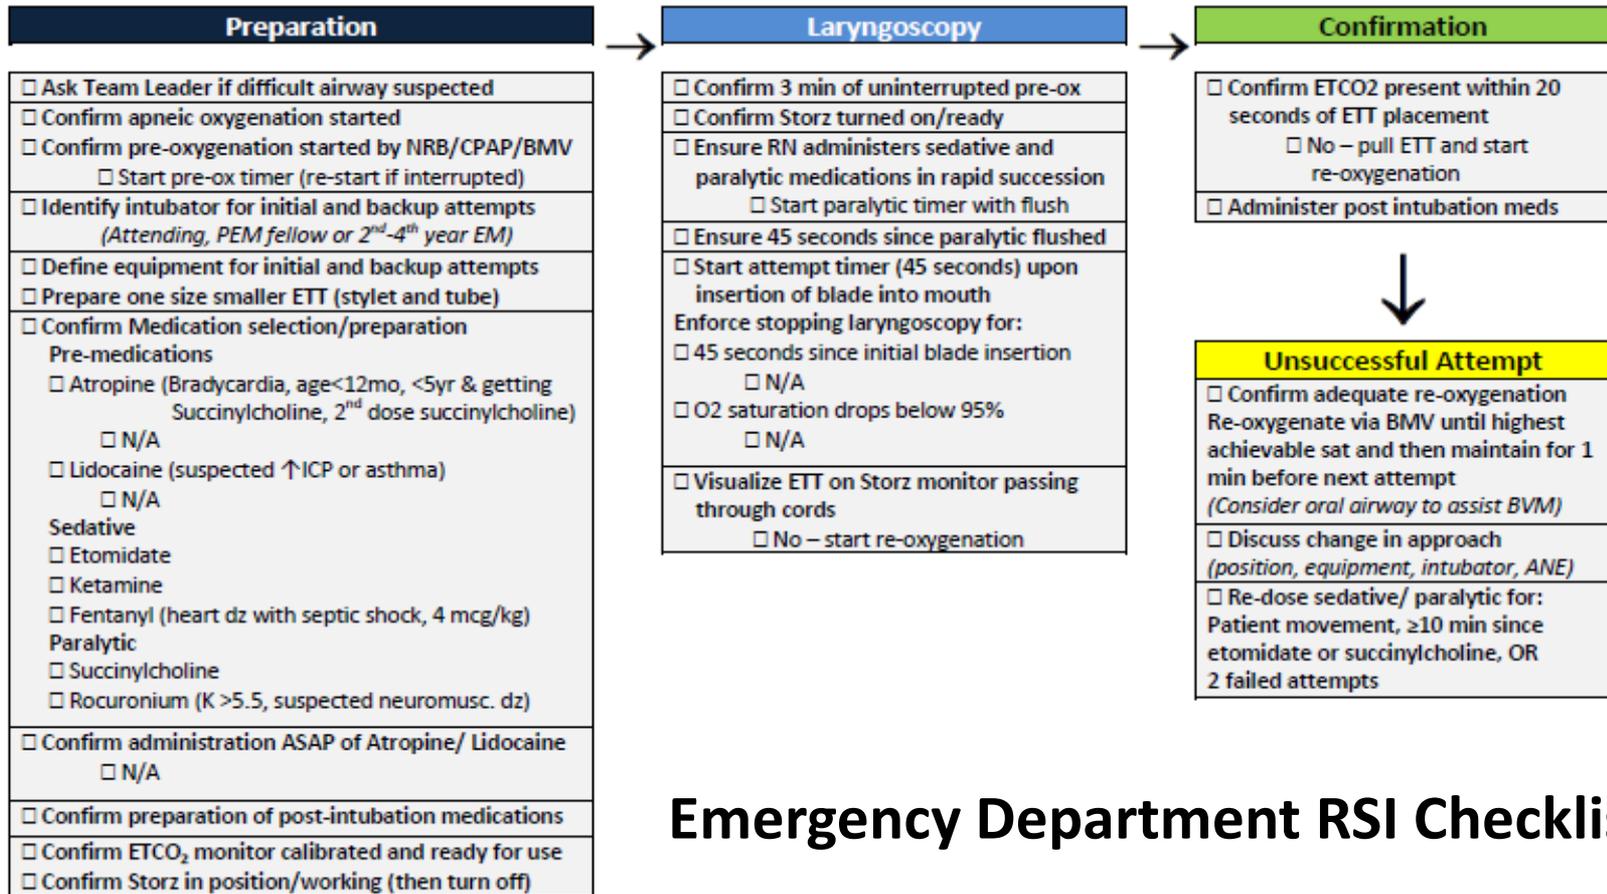

Technical Training

Knowledge around RSI

Skills with Video Laryngoscopy

Attitudes around timing,
including empowerment of staff

Strategy

Emergency Department RSI Checklist

Preparation

<input type="checkbox"/> Ask if a difficult airway suspected (consider CAT)
<input type="checkbox"/> Is the PICU-ED Team (PET) needed? (see reverse)
<input type="checkbox"/> Confirm apneic oxygenation (rate 2 L/kg, max 15 lpm)
<input type="checkbox"/> Confirm pre-oxygenation started by NRB/CPAP/BMV <ul style="list-style-type: none"><input type="checkbox"/> Start pre-ox timer (re-start if interrupted)
<input type="checkbox"/> Identify intubator: any attending, PEM fellow, 2 nd -4 th year EM resident, <i>approved respiratory therapist</i>
Pre-medications <ul style="list-style-type: none"><input type="checkbox"/> Atropine if: bradycardia, age < 12 mos, <5 yr & giving sux, or 2nd dose of sux (give ASAP)
<input type="checkbox"/> Confirm RSI Medication Selection
Sedatives <ul style="list-style-type: none"><input type="checkbox"/> Etomidate<input type="checkbox"/> Ketamine<input type="checkbox"/> Fentanyl if: heart dz with septic shock (4 mcg/kg)
Paralytics <ul style="list-style-type: none"><input type="checkbox"/> Succinylcholine<input type="checkbox"/> Rocuronium if: K >5.5, suspected neuromuscular disease, or hx of malignant hyperthermia
<input type="checkbox"/> Confirm atropine given (if indicated)
<input type="checkbox"/> Confirm preparation of post-intubation medications
<input type="checkbox"/> Confirm RT prepared airway cart/Storz

**Second senior physician at bedside to be in charge of the checklist
“CO-PILOT”**

Use of apneic oxygenation & pre-oxygenation

Limited recommendations for pre-medications, sedatives & paralytics

Laryngoscopy

- Confirm 3 min of uninterrupted pre-ox
- Confirm RT/proceduralist record attempt
- Ensure sedative and paralytic in rapid succession (med-flush-med-flush)
 - Start paralytic timer with flush
- Ensure 45 seconds since paralytic flushed
- Start attempt timer (45 seconds) upon insertion of blade into mouth
- Stop attempt for:**
 - 45 seconds timer (alarms)
 - O₂ saturation drops below 95%
- Visualize ETT on Storz monitor passing through cords
 - No – start re-oxygenation

STORZ C-MAC VIDEO LARYNGOSCOPY

Timing of intubation attempt in relation to RSI medications

Limitation on duration of laryngoscopy

Confirmation

- Confirm capnometry tracings are present within 20 sec of ETT insertion
 - No – pull ETT and start re-oxygenation
- Administer post-intubation meds

Unsuccessful Attempt

- Confirm adequate re-oxygenation
Re-oxygenate via BMV until highest achievable sat and then maintain for 1 min before next attempt
(Consider oral airway to assist BVM)
- Discuss *specific* change in approach
(position, equipment, intubator, ANE)
- Re-dose sedative/ paralytic for:
patient movement OR 2 failed attempts

Recovery techniques for missed intubations, including timing

Strategy

Course	Setting	Foci
ED Procedural Training	Lab	Video Laryngoscopy
ED/ICU Bootcamp	Lab	Video Laryngoscopy, Checklist
ED Patient Safety*	Lab	Checklist, Co-piloting
ED Team Safety*	Lab	Checklist, Co-piloting
Trauma Team*	Lab	Checklist, Co-piloting
ED In Situ*	Trauma Bay	Video Laryngoscopy, Checklist, Co-piloting
Airway Management	Lab, Trauma Bay, Classroom	Video Laryngoscopy
Medical Video Review*	Classroom	Video Laryngoscopy, Checklist, Co-piloting

*interprofessional +/- multidisciplinary training

Outcomes

	Baseline (2009-2010) n=114	Intervention (2012-2013) n=105	Operational (2014-2018) n=377
Age (median, IQR) < 24 months	2.4 (0.4, 10.1) 53 (46%)	3.0 (0.4, 10.8) 43 (41%)	2.3 (0.4, 10.6) 186 (47%)
Diagnostic Category			
Neurologic	39 (34%)	33 (31%)	141 (36%)
Respiratory	29 (26%)	13 (13%)	101 (26%)
Trauma	21 (18%)	22 (22%)	91 (23%)
Shock	13 (11%)	21 (21%)	27 (7%)
Other	12 (11%)	13 (13%)	36 (9%)
Attempt Success			
First	59 (52%)	66 (63%)	266 (67%)
First or Second	84 (74%)	92 (90%)	335 (85%)

Outcomes

	Baseline (2009-10) n=114	Intervention (2012-13) n=108	Operational (2014-19) n>300
Use of checklist	n/a	87%	93%
Attempt < 45 sec	72%	87%	93%
Video Laryngoscopy	n/a	85%	94%
Desaturation	33%	18%	18%
Esophageal placement	20%	<2%	<2%

Outcomes

c) Failure to Perform Adequate Preoxygenation before the 1st Attempt at Laryngoscopy

Next steps

- This strategy was expanded to focus on high-risk intubations:

- Ask if a difficult airway suspected (consider CAT)
- Is the PICU-ED Team (PET) needed? (see reverse)

- Difficult airway
 - Critical Airway Team (CAT): Anesthesia, ENT, Respiratory Therapy and a similar checklist tool
 - 13 activations in the ED since 2015
 - >100 activations hospital wide
- Physiologically challenging patient
 - PICU- ED Team (PET): Critical Care, Emergency Medicine, Respiratory Therapy and an a novel checklist tool
 - 13 activations in the ED since 2019

Next steps

*Data for all *medical* RSI cases from 2016-present.

	Non-PET Eligible (Historical Controls by Chart Review)	PET Eligible (Historical Cases by Chart Review)	PET Intubations Since Go- Live in April 2019 (Obtained by Video Review)
Total*	180 (82.9%)	37 (17.1%)	13
Peri-intubation arrest	0/180 (0%)	2/37 (5.4%)	0/13 (0%)
Any post-intubation STS arrest	0/180 (0%)	4/37 (10.8%)	0/13 (0%)
In-hospital Mortality	5/179 (2.8%)	9/36 (25%)	2/13 (15.4%)
ECMO	0/179 (0%)	3/36 (8.3%)	1/13 (7.7%)
First pass success	120/180 (66.7%)	18/37 (48.6%)	8/13 (61.5%)
IVF prior to RSI	127/180 (70.6%)	36/37 (97.2%)	12/13 (92.3%)
Vasopressor support prior to RSI	0/180 (0%)	11/37 (29.7%)	5/13 (38.5%)
Defibrillator pads on prior to RSI	n/a	n/a	6/13 (46.2%)
Backboard under patient prior to RSI	n/a	n/a	6/13 (46.2%)

Dean P, et al. *Unpublished data*. Abstract accepted to PAS Meeting May 2020.

Summary

- Simulation can increase the “n” when faced with infrequent, high risk clinical situations in healthcare, creating a safe and efficient setting for training & assessment
- Simulation is a great strategy for quality improvement science
- Lessons learned from one simulation-based project translate across clinical units and care processes
